**Task:** Find a path through the city that would cross each bridge once and only once.

# Basic definitions

**Def.** *Graph*  $G = (V, E)$  is a set of *vertices*  $V$ , with a set of *edges*  $E$  between them.

**Def.** Each edge has *two endpoints*.

**Def.** An edge *joins* its endpoints, two endpoints are *adjacent* if they are joined by an edge.

**Def.** An edge is said to be *incident* to the vertices it joins.

Bipartite graphs

Graph coloring

Graph representations

Paths and Cycles

Deleting some vertices or edges from a graph leaves a **subgraph**.  
Formally:

**Def.** A **subgraph** of  $G = (V, E)$  is a graph  $G' = (V', E')$  where  $V'$  is a nonempty subset of  $V$  and  $E'$  is a subset of  $E$ .

$$V' = \{a, c, f, e\}$$

$$E' = \{\{a, c\}, \{c, f\}\}$$

# Variants: Multigraph

**Def.** In *simple graphs*, each pair of distinct vertices has at most one edge.

**Def.** Graphs that may have multiple edges connecting the same vertices are called *multigraphs*

# Degree in undirected graphs

**Def.** The *degree* of a vertex in an undirected graph is the number of edges incident with it, except that a loop at a vertex contributes twice to the degree of that vertex.

The degree of the vertex  $v$  is denoted by  $\deg(v)$ .

$$\begin{array}{lll} \deg(a) = 7, & \deg(b) = 2, & \deg(c) = 4, \\ \deg(d) = 4, & \deg(e) = 0, & \deg(f) = 1. \end{array}$$

1. Prove that there is no group of 7 people such that each person in the group has exactly 3 friends in the group.

Friendship is always mutual.

That is, in math-speak, the *friendship relationship is symmetric*.

2. Then, try to prove that in any group of  $n \geq 2$  people, there are at least 2 people with the same number of friends in the group.

# Degree in directed graphs

**Def.** In directed graphs, there are similar notions of *in-degree* and *out-degree*, denoted by  $\deg^-(v)$  and  $\deg^+(v)$  respectively

$$\deg^-(a) = 3, \quad \deg^+(a) = 3, \quad \deg^-(b) = 1, \quad \deg^+(b) = 1,$$

$$\deg^-(c) = 1, \quad \deg^+(c) = 3, \quad \deg^-(d) = 2, \quad \deg^+(d) = 1,$$

$$\deg^-(e) = 0, \quad \deg^+(e) = 0, \quad \deg^-(f) = 1, \quad \deg^+(f) = 0.$$

**Def.** A *matching*  $M$  in a simple graph  $(V, E)$  is a subset of  $E$  such that no two edges from  $M$  are incident with the same vertex.

In other words, a matching is a set of *disjoint* edges.

Also, we can introduce maximum, maximal, perfect matchings.

# Complete matching from $V_1$ to $V_2$

**Def.** We say that a matching  $M$  in a bipartite graph  $G = (V, E)$  with bipartition  $(V_1, V_2)$  is a *complete matching from  $V_1$  to  $V_2$*  if every vertex in  $V_1$  is the endpoint of an edge in the matching, or equivalently, if  $|M| = |V_1|$ .

So, every job is assigned to some employee, and no employee is assigned to more than one job.

# Graph coloring and bipartite graphs

Graph coloring is a task to assign colors to each vertex of the graph so that no two adjacent vertices are assigned the same color.

**Def.** A graph  $G$  is  *$k$ -colorable* if each vertex can be assigned one of  $k$  colors so that adjacent vertices get different colors.

**Theorem.** A simple graph is *bipartite* if and only if it is *2-colorable*.

**Def.** The *chromatic number* of a graph is the least number of colors needed for a coloring of this graph. It's denoted by  $\chi(G)$ .

The following theorem helps to estimate the chromatic number.

**Theorem.** A graph  $G$  with maximum degree at most  $k$  is  $(k + 1)$ -colorable:

$$\max_{v \in V} (\deg(v)) \leq k \quad \rightarrow \quad G \text{ is } (k + 1)\text{-colorable.}$$

# Graph coloring

$$\max_{v \in V} (\deg(v)) \leq k \quad \rightarrow \quad G \text{ is } (k + 1)\text{-colorable.}$$

*Proof.* The theorem can be proved by induction.

*The base case.* A graph with  $|V| = 1$  does not have edges, so the maximum degree is 0, and the graph is 1-colorable.

*Inductive step.* Assume that a graph with  $n - 1$  vertices and maximum degree at most  $k$  is  $(k + 1)$  colorable.

Now, prove that a graph with  $n$  vertices and maximum degree at most  $k$  is  $(k + 1)$  colorable ...
