

Paths. Connectivity.  
Euler and Hamilton Paths.  
Planar graphs.

# Path

**Def.** A *path* from  $s$  to  $t$  is a sequence of edges

$$\{x_0, x_1\}, \{x_1, x_2\}, \dots, \{x_{n-1}, x_n\},$$

where  $x_0 = s$ , and  $x_n = t$ .

**Def.** The *length* of a path is the number of edges in it.

$$\{E, A\} \{A, B\} \{B, D\} \{D, A\} \{A, B\} \{B, C\} \{C, F\}$$

# Simple path. Cycle

**Def.** A *simple path* is a path that does not contain the same edge more than once.

**Def.** A path is called a *cycle* (or *circuit*) if its first and last vertices are the same, and its length is greater than 0.

**Def.** A *simple cycle* is a cycle that does not contain the same edge more than once.

# Paths and cycles in directed graphs?

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

There are similar definitions for paths and cycles in directed graphs.

# Connected graph

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

**Def.** An undirected graph is called *connected* if there is a path between every pair of distinct vertices of the graph.

# Connected components

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

**Def.** A *connected component* of a graph  $G$  is a connected subgraph of  $G$  that is not a proper subgraph of another connected subgraph of  $G$ .

(So, a connected component is a maximal connected subgraph)

*Question:* How many connected components is in the graph?

# Vertex cut

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

**Def.** A *vertex cut*  $V'$  is a subset of vertices, such that the graph becomes disconnected, if  $V'$  and their incident edges are removed.

# Vertex cut

**Def.** A *vertex cut*  $V'$  is a subset of vertices, such that the graph becomes disconnected, if  $V'$  and their incident edges are removed.

Example:  $V' = \{E\}$ .

This is one of three minimum vertex cuts in this graph. Can you find the other two?

Connectivity

Euler paths

Hamilton paths

Planar graphs

# Distance and diameter

**Def.** The *distance* between two vertices in a graph is the length of the shortest path between them.

$$\text{distance}(A, H) = 3$$

**Def.** The *diameter* of a graph is the distance between the two vertices that are farthest apart.

$$\text{diameter} = 3$$

# Euler path and cycle

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

**Def.** An *Euler cycle* in a graph  $G$  is a simple cycle containing every edge of  $G$ .

Similarly, an *Euler path* in  $G$  is a simple path containing every edge of  $G$ .

(In a simple path (or cycle), edges are not repeated)

# Euler cycle

Walk across all the bridges once.  
And get back to the original location.

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

# Euler cycle

Walk across all the bridges once.  
And get back to the original location.

What if we build two new bridges?

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

# Observation

Let's say that *we cross a bridge to the vertex A*.

What is the condition to continue walking?

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

# Observation

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

Let's say that *we cross a bridge to the vertex A*.

What is the condition to continue walking?

There should be *at least one more bridge* at the vertex A.

# Observation

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

When we enter a vertex and then leave it, we use *two bridges*.

So, every time we visit a vertex, two bridges are gone.

# Finding an Euler cycle

If we visit a vertex, we use two bridges.

If there is an even number of bridges at the vertex  $A$ , then after our visit, there is still an even number of bridges.

If a vertex has only one bridge, it can be only the final point in the path.

Planar graphs

**Def.** A simple path in a graph  $G$  that passes through every vertex exactly once is called a *Hamilton path*.

And a simple cycle in a graph  $G$  that passes through every vertex exactly once is called a *Hamilton cycle*.

# Sufficient conditions for a cycle

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

**Theorem** (Dirac's theorem). If  $G$  is a simple graph with  $n$  vertices with  $n \geq 3$  such that

*the degree of every vertex in  $G$  is at least  $n/2$ ,*

then  $G$  has a Hamilton cycle.

**Theorem** (Ore's theorem). If  $G$  is a simple graph with  $n$  vertices with  $n \geq 3$  such that

$$\deg(u) + \deg(v) \geq n$$

for every pair of *nonadjacent* vertices  $u$  and  $v$  in  $G$ , then  $G$  has a Hamilton cycle.

# Algorithm for finding a cycle?

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

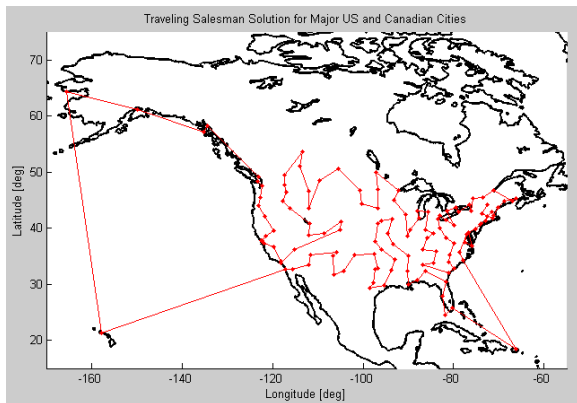

The best algorithms known for finding a Hamilton cycle in a graph or determining that no such cycle exists have *exponential worst-case time* complexity in the number of vertices of the graph.

In fact, this is an NP-complete problem.

# More Hamilton cycles

The famous Traveling Salesperson Problem (TSP):

Find the shortest route a traveling salesperson should take to visit a given set of cities.

It reduces to finding a Hamilton cycle on a complete graph such that the total weight of the path is the smallest.

Planar graphs

*Question:* Is it possible to join these houses and utilities so that none of the connections cross?

This is a complete bipartite graph, denoted by  $K_{3,3}$ .

# Planar graphs

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

**Def.** A graph is called *planar* if it can be drawn in the plane without any edges crossing.

Complete graph  $K_4$  is planar:

# Planar graphs

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

**Def.** A graph is called *planar* if it can be drawn in the plane without any edges crossing.

3-dimensional hypercube graph,  $Q_3$ , is planar:

# Euler formula

A drawing of a planar graph divides the plane into *faces*, regions bounded by edges of the graph.

four faces:

**Theorem** (Euler formula). Let  $G$  be a connected planar simple graph with  $e$  edges and  $v$  vertices. Let  $r$  be the number of faces in a planar representation of  $G$ . Then

$$v - e + f = 2.$$

Paths and Cycles

Connectivity

Euler paths

Hamilton paths

Planar graphs

**Theorem (Kuratowski).** A graph is planar if and only if it does not contain a subdivision of  $K_{3,3}$  or  $K_5$ .

What is a *subdivision*? Inserting a new vertex into an existing edge of a graph is called subdividing the edge, and one or more subdivisions of edges create a subdivision of the original graph.

$K_{3,3}$

$K_5$
